Hi All,

It feels great that our institute is trying to get what is best in the market for students. I am assured that, this will help
them to be prepared for IT industry.

Though current syllabus looks really good, I would like to give some inputs which will help students in grooming
themselves better.

1. Devops : When working in a large scale infrastructure as an administrator (OS, Application etc) it becomes difficult
to keep the environment updated, in required state, and to get the tasks completed in a short time, where devops has
emerged and has become a must have skill set. Devops engineer/developer/admin are becoming highly paid jobs
than just being an developer/administrator. Devops is nothing but automation of administrative
tasks/development using tools such as Ansible, terraform, kubernetes, Git, JIRA to name a few of the many such
devops tools.

2. Cloud: Many devops tools are integrated with Cloud platforms such as AWS, Azure etc.

3. Cyber security/ cloud security: This is one of the field which is growing rapidly in IT industry.

I feel these should be introduced in syllabus as an optional/selective subjects, so that based on their personal interest
students will get an opportunity to explore and learn.

Thanks.
